

Farm Website Manual

> Login and Dashboard page :-

Hello everyone, Namaste from Indus Poultry Equipment!

Thank you for joining Indus Poultry Equipment. We are excited to introduce you to our Farm Management System, designed to help poultry farmers manage their operations more efficiently and effectively.

This is the Login Page of the application. To ensure secure access, we will provide you with unique admin credentials. Using these credentials, you can log in to the system and access your farm data anytime and from anywhere. Whether you want to monitor daily activities, check reports, or review important farm information, everything is available at your fingertips.

Each module plays an important role in managing different aspects of the farm. For example, Batch Management helps you track batch performance, Weighbridge Management helps monitor vehicle and material movements, Attendance Tracking helps manage workforce records, and the Shed Supervisor module helps monitor day-to-day activities inside the sheds. The goal of this system is to provide accurate, real-time information that helps farmers and management teams make better decisions, improve productivity, and maintain complete visibility over farm operations. Now, let's go through each feature one by one and understand how they work.

Once you successfully log in, you will be redirected to the Dashboard. The Dashboard serves as the central hub of the entire application, providing a quick overview of your farm operations. Here, you can view important updates, monitor key performance indicators, and access various modules without any difficulty.

On the left-hand side, you will find the Navigation Menu or Sidebar. This sidebar contains a wide range of features that are designed specifically for poultry farm management. Some of the major modules include Batch Management, Weighbridge Management, Attendance Tracking, Shed Supervisor Monitoring, Daily Farm Activities, Reports, and many other useful functions.

Now, let's explore each feature one by one and understand how it works.

> Configuration page :-

The first step is to go to the **Configuration** feature. Here, you can see different configuration options, as shown in the video. In this section, we need to configure each setting one by one according to the farm requirements.

First, we need to configure the **Sheds**. When we click on the **Configure Shed** option and enter the required number of sheds, the system will automatically create that many sheds.

Similarly, we have the **Chick and Grower Configuration**. Here, we need to enter the number of chick sheds and grower sheds available on the farm. Based on the number entered, the system will automatically consider and create those sheds for further operations.

Next, we have the **Location Configuration**. This is a very useful feature, especially for Profit & Loss analysis and Attendance Management. With location configuration, we can identify where a particular employee is working and track farm activities location-wise. This helps in better monitoring and management of operations across different farm locations.

After that, we have the **Shed Box Configuration**. This feature is mainly used for feed trolley management. For example, if a feed trolley contains 5 boxes, 7 boxes, or 8 boxes, we simply enter the required number, and the system will automatically create those boxes for tracking and management purposes.

Before using the **Supervisor Configuration**, we first need to register the supervisor. In the sidebar, you will find the **Registration** option. Here, you need to register the supervisor by entering the required details. Once the registration is completed, the supervisor's name will be available in the system.

Next is the **Supervisor Configuration**. This feature is very useful for assigning access and permissions to supervisors. Once the supervisor is registered, you can select the supervisor's name and provide access to specific features and modules based on their responsibilities. This helps in ensuring that each supervisor can access only the required sections of the application and perform their assigned tasks efficiently.

This is all about the **Configuration Page**. Once these configurations are completed, the system is ready for smooth and efficient farm operations.

> Batch :-

This is the **Batch Feature**, where you can manage and monitor all batch-related information. Whenever a new batch starts on the farm, you need to enter the batch details through this form.

While creating a new batch, the **Batch ID** must be maintained from your end. Before entering a new batch, it is important to check the last Batch ID available in the system and then enter the next Batch ID accordingly. This helps maintain proper batch records and avoids duplicate entries.

In this form, you need to enter all the required batch information. Once the data is saved, the system will help you track important details such as the total number of birds purchased at the beginning of the batch, the current live bird count, and the running age or week of the batch.

Generally, when a new batch arrives at the farm, it will be placed in a **Chick Shed** or **Grower Shed**. At that time, you need to enter the batch details and assign the appropriate shed in the system.

As the birds grow, there may be situations where the batch needs to be shifted from one shed to another. In such cases, there is no need to create a new batch. Simply click on the **Edit** option, update the shed number, and save the changes. The system will then reflect the new shed location for that batch.

This feature is very useful for understanding the complete status of a batch at any point in time. You can easily monitor the age of the birds, track the current live bird count, and review batch progress throughout the production cycle.

Additionally, the dashboard provides graphical representations that make the data easier to understand. You can view the **Live Birds Count** and the **Running Week** in graph format, allowing you to quickly analyze the batch performance and current status.

Overall, the Batch Feature helps maintain accurate batch records, track bird growth, monitor live bird counts, and manage shed movements efficiently throughout the batch lifecycle.

This is all about the **Batch Feature**.

> Weighbridge :-

This is the **Weighbridge Feature**, where all weighbridge-related data is maintained and monitored. Any vehicle that enters or exits the farm with materials will be recorded here. Information such as the vehicle number, material type, quantity received or dispatched, and other weighbridge details will be available in this section.

This feature is very important because it helps us maintain complete records of all stock movements. For example, if we want to know how many maize vehicles entered the farm during a particular year, we can easily retrieve that information from this feature. Similarly, we can track all stock inward and outward movements, helping us maintain accurate inventory records and better control over farm operations.

While entering data, you will find two options: **With Weighbridge** and **Without Weighbridge**. Based on your requirement, you can select the appropriate option and proceed with the data entry.

The form contains various fields that need to be filled one by one. These include details such as ID, Kata Slip Number, Date, Vehicle Number, Material Name, Gross Weight, Empty Weight, Net Weight, and other required information. Once all the details are entered, the system will automatically calculate and maintain the weighbridge records.

If a new material is being received that is not already available in the system, you can simply select the **Add New Material** option. This will allow you to create and save a new material, which can then be used for future weighbridge entries.

Another important field is the **Type** selection. Here, you need to choose whether the transaction is a **Purchase**, **Sale**, or **Free** entry. This classification helps maintain proper records and supports accurate reporting throughout the system.

The **Driver Number** and **Owner Number** fields are optional and can be filled whenever the information is available.

Additionally, there is an option called **Add to Account**. By enabling this option, you can enter the **Price Per KG** of the material. Once saved, this information will automatically update in the **Feed Material Prices** feature. This functionality is extremely useful because it helps track the current cost of materials and provides accurate data for Profit & Loss calculations and financial analysis.

The Weighbridge Feature also provides powerful filtering and search capabilities. You can easily view records based on different time periods such as **Today**, **Yesterday**, and other date ranges. In addition, the search option allows you to find records quickly using

filters such as Date, Material Name, Vehicle Number, Purchase, Sale, and many other criteria.

Overall, the Weighbridge Feature provides complete visibility into material movements, stock transactions, and pricing information. It helps maintain accurate records, supports inventory management, and plays a key role in analyzing the profitability and operational efficiency of the farm.

This is all about the **Weighbridge Feature**.

> Labour Details :-

This is the **Labour Details Feature**, where we need to enter and maintain all the details related to the labour working on the farm. This feature is very important because it allows us to access the information of any labour at any time whenever required.

In this section, we can store important details such as the labour's name, contact information, joining details, and other necessary information. Maintaining these records helps us keep all labour-related data organized in one place.

One of the most important fields in this feature is the **Status** option. The status indicates whether the labour is currently working with the organization or not. If the labour is actively working with the organization, the status should be marked as **Active**. If the labour has left the organization, the status should be changed to **Inactive**.

This status management is very important because only the labour marked as **Active** will appear in the Attendance module. This helps ensure that attendance is recorded only for the employees who are currently working on the farm and prevents unnecessary or incorrect attendance entries.

Another useful advantage of this feature is that all labour records can be updated whenever required. If there are any changes in labour information in the future, we can simply edit the existing record and update the details accordingly.

Additionally, maintaining labour information in the system helps create a proper historical record. Even if a labour leaves the organization, their information remains available for future reference whenever required. This makes it easy to track previous records and access labour-related information at any time.

Overall, the Labour Details Feature helps maintain accurate employee records, supports attendance management, and ensures that all labour information is easily accessible and manageable from a single location.

This is all about the **Labour Details Feature**.

> **Labour Attendance :-**

This is the **Attendance Feature**, where we can manage and monitor the daily attendance of all labour and employees working on the farm.

To enter attendance, click on the **Add New** button. Once you click on it, an attendance form will open. In this form, the first step is to select the employee or labour name. Only the names that are marked as **Active** in the **Labour Details** feature will appear in this list. This ensures that attendance is recorded only for employees who are currently working with the organization.

After selecting the employee name, you need to mark the attendance status. If the employee is present for the full day, select **Present**. If the employee has worked only for half a day, then select **Present/2** or the half-day option available in the system.

Next, you need to select the **Location** where the employee worked on that particular day. These locations are automatically populated from the **Location Configuration** section that was configured earlier in the system. This helps us understand where each employee is working and track labour allocation across different farm locations.

Once all the details are entered and saved, the attendance record will be stored in the system.

One of the major advantages of this feature is that you can view attendance records for an entire month in a single place. This makes it easy to monitor employee attendance and track workforce availability.

If you want to view attendance for a specific month, simply use the **Month** selection option available in the feature. After selecting the required month, the system will automatically display all attendance records for that month.

This helps management understand how many employees were present during a particular month and provides a clear overview of attendance trends.

At the end of the attendance report, you will also find a **Total** section. This section displays the total number of days each employee has worked on the farm during the

selected month. This information is very useful for attendance tracking, payroll calculations, and workforce management.

Overall, the Attendance Feature helps maintain accurate attendance records, track employee workdays, monitor labour allocation by location, and provide a complete monthly attendance summary.

This is all about the **Attendance Feature**.

>Feed Feeding Shad :-

This is the **Supervisor Feed Feeding Feature**, which is used to record the feed quantity provided to each shed on a daily basis.

In this feature, you will see the **Box Numbers**. These box numbers are automatically taken from the **Shed Box Configuration** that was configured earlier. The feed trolley box numbers created during configuration will be available here for selection and usage.

To enter the feed feeding data, the supervisor needs to fill out the form. First, select the **Shed Number** where the feed is being provided. After selecting the shed, enter the feed quantity in kilograms for each box. Based on the number of boxes used, you need to enter the exact quantity of feed that has been provided to the birds.

Once the data is saved, it becomes part of the farm records and is automatically reflected in the **Summary Reports**. This is very useful because it helps management understand how much feed has been consumed by the birds and monitor daily feed usage across different sheds.

Another useful feature is the **Date Filter** option. By selecting a specific date, you can easily view the historical feed feeding records. This allows you to review previous entries, analyze feed consumption trends, and verify feeding data whenever required.

Overall, this feature helps maintain accurate feed feeding records, track feed consumption shed-wise, and provides valuable data for production analysis and farm management.

This is all about the **Supervisor Feed Feeding Feature**.

>Shed Mortality:-

This is the **Shed Mortality Feature**, where supervisors need to enter the daily mortality details for each shed. At the end of every day, the supervisor should update the mortality count in the system. This helps maintain accurate records of bird mortality across the farm.

Using this feature, we can easily understand how much mortality is occurring in each shed and monitor mortality trends shed-wise. This information is very useful for tracking flock health and identifying sheds that may require additional attention or management.

To add a new mortality entry, simply click on **Add New**. Then, select the appropriate **Shed Number** and enter the **Mortality Count** for that day. Once the information is saved, the system will automatically update the records.

One of the major advantages of this feature is that whenever mortality is entered, the same number of birds will automatically be reduced from the **Live Birds Count**. This ensures that the live bird data remains accurate and up to date without requiring any manual calculations.

The Live Birds Count that is displayed throughout the system is directly maintained based on the mortality entries recorded here. Because of this, accurate mortality entry is very important for maintaining correct batch and flock information.

Overall, this feature helps track daily mortality, maintain accurate live bird counts, and provide shed-wise mortality analysis for better farm management and decision-making.

This is all about the **Shed Mortality Feature**.

>Shed Production

In the **Supervisor** section, we have different features available for daily farm operations. One of the most important features is the **Supervisor Production** feature.

In this feature, the supervisor is required to enter the daily production details. This feature is very important because it helps us monitor and verify whether the supervisor is reporting the correct egg production data on a daily basis.

To enter the production data, the supervisor simply needs to open the form and fill in the required details. Information such as the total number of trays produced, damaged eggs, loose eggs, and other production-related details need to be entered in the system. Once the data is submitted, it becomes available for management review and analysis.

One of the major advantages of this feature is that the data can be accessed anytime and from anywhere. This allows management to monitor daily production without having to be physically present at the farm.

Additionally, if any corrections are required in the future, the records can be edited and updated accordingly. This ensures that the production data remains accurate and up to date.

Overall, the Supervisor Production feature helps maintain daily production records, improves transparency, and provides an easy way to monitor egg production, damaged eggs, and other important production parameters.

This is all about the **Supervisor Production Feature**.

>Birds Weight :-

This is the **Birds Weight Feature**, where we record the weekly bird weight to monitor the growth of the birds.

Here, you need to enter the **line-wise average weight**. For each line, weigh **five birds**, calculate the average weight, and enter that value into the system. This process should be done **once every week**.

To add a new record, simply click on the **Add New** button, enter the required details, and save the data. Once the information is saved, the system will automatically maintain the bird weight records and display the **average bird weight**.

This feature is very useful for monitoring bird growth and ensuring that the birds are achieving the expected weight every week.

This is all about the **Birds Weight Feature**.

>Supervisor Water Medicine Dashboard

This is the **Supervisor Water Medicine Dashboard** feature, where supervisors need to record the daily water medicine usage for each shed.

To enter a new record, simply click on **Add New**, select the **Shed Number**, enter the **Quantity**, and then select the **Medicine** that is being used. After entering all the required details, click **Save**, and the data will be stored in the system. You can also view all the previously entered records in this feature.

One of the main advantages of this feature is that whenever you enter the water medicine usage, the same quantity will automatically be reduced from the available medicine stock. This ensures that the stock is always updated accurately without any manual calculation.

This feature helps maintain proper medicine usage records and accurate stock management.

This is all about the **Supervisor Water Medicine Dashboard** feature.

>Egg Production From Shed:-

This is the **Egg Godown Feature**, where the user needs to enter the daily shed-wise egg production. Using this feature, we can easily understand how much egg production is coming from each shed on a daily basis.

The Egg Godown Supervisor needs to enter the production details, such as the number of **egg trays received from each shed**. After receiving the eggs, they also need to segregate them into four categories: **Good Eggs, Damaged Eggs, Big Eggs, and Small Eggs**. The quantity can be entered in both **trays** and **loose eggs**.

This feature is very useful because it helps maintain accurate production records, and the data entered here is also used for **Profit & Loss** calculations.

Additionally, we have a **Date Filter** option, which allows you to view the production data for any particular date whenever required.

This is all about the **Egg Godown Feature**.

>Egg For Sale :-

This is the **Egg for Sale Feature**, where we maintain all the egg sale records. This feature helps us track the eggs that are sold to different dealers and maintain accurate sales data.

To create a new sale entry, click on the **Add New** button. Here, you need to select the **Shed Number**, enter the **Number of Trays, Loose Eggs**, select the **Type of Eggs**, and enter the **Sale Person or Dealer Name**. After filling in these details, save the record, and the sale information will be stored in the system.

We also have another option called **Damage Eggs During Sale**. This feature is used to record the eggs that are returned as damaged after the sale. Here, you need to select

the **Party Name** and enter the **Number of Damaged Trays** and **Loose Eggs** that were returned. Based on the selected party, the returned damaged trays and loose eggs will automatically be recorded and considered in the system.

This feature helps maintain accurate egg sale records, track damaged returns, and ensure proper stock management.

This is all about the **Egg for Sale Feature**.
